

Sclerotinia control in green beans

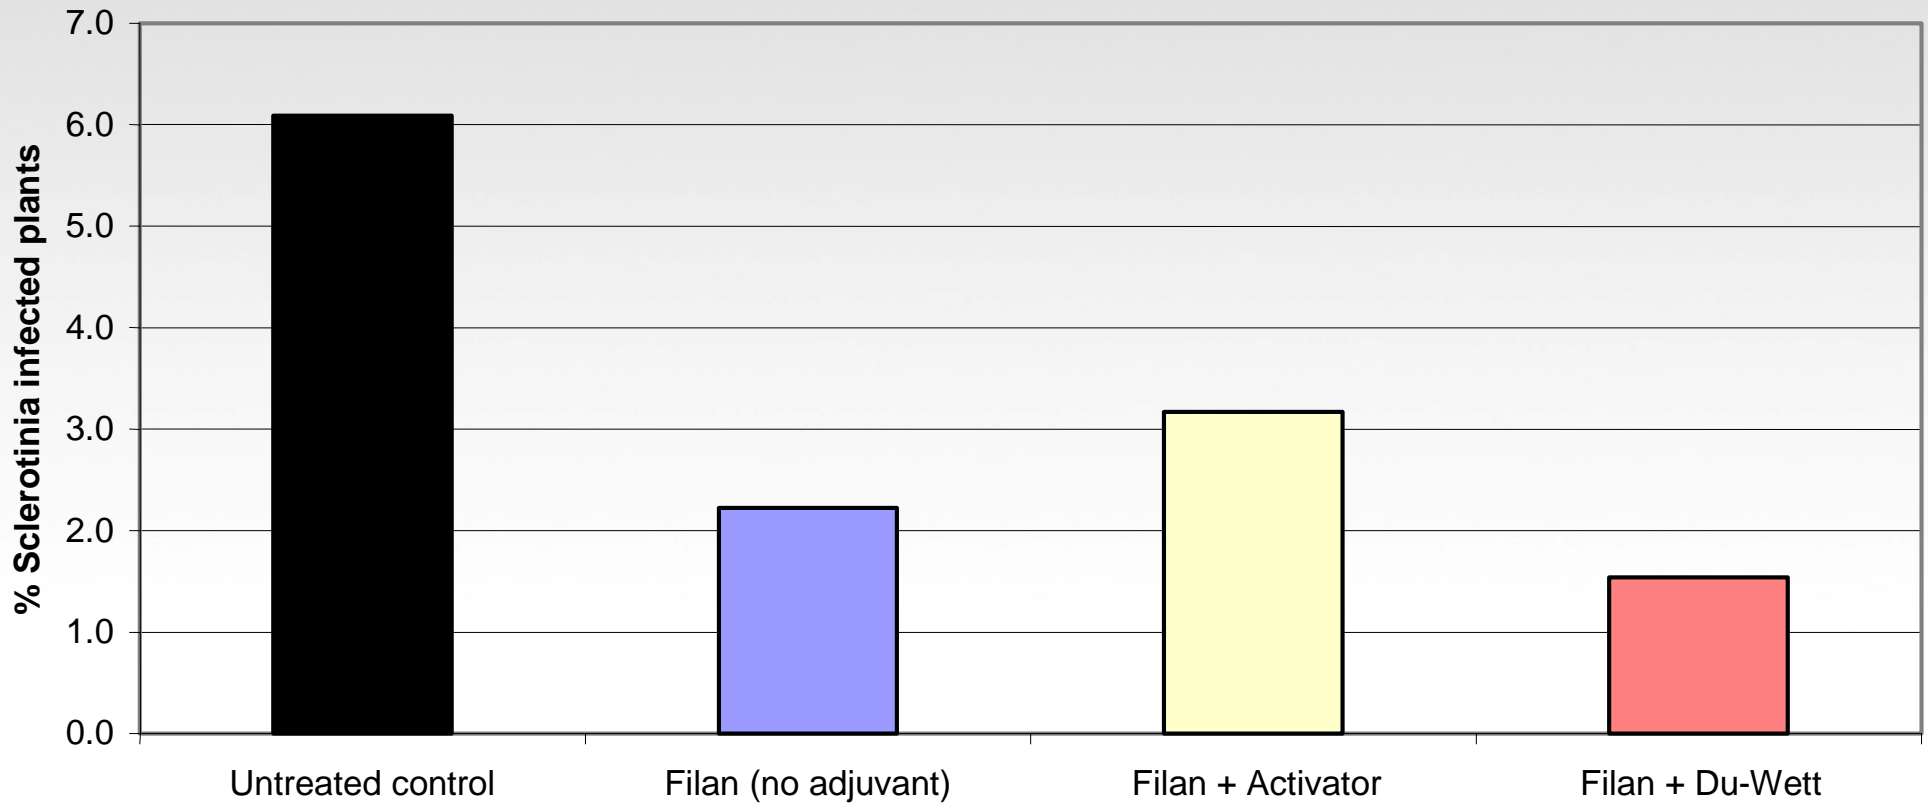

Dr. Hoong Pung (HAL project VG05090)

Treatment effects on Sclerotinia incidence on beans

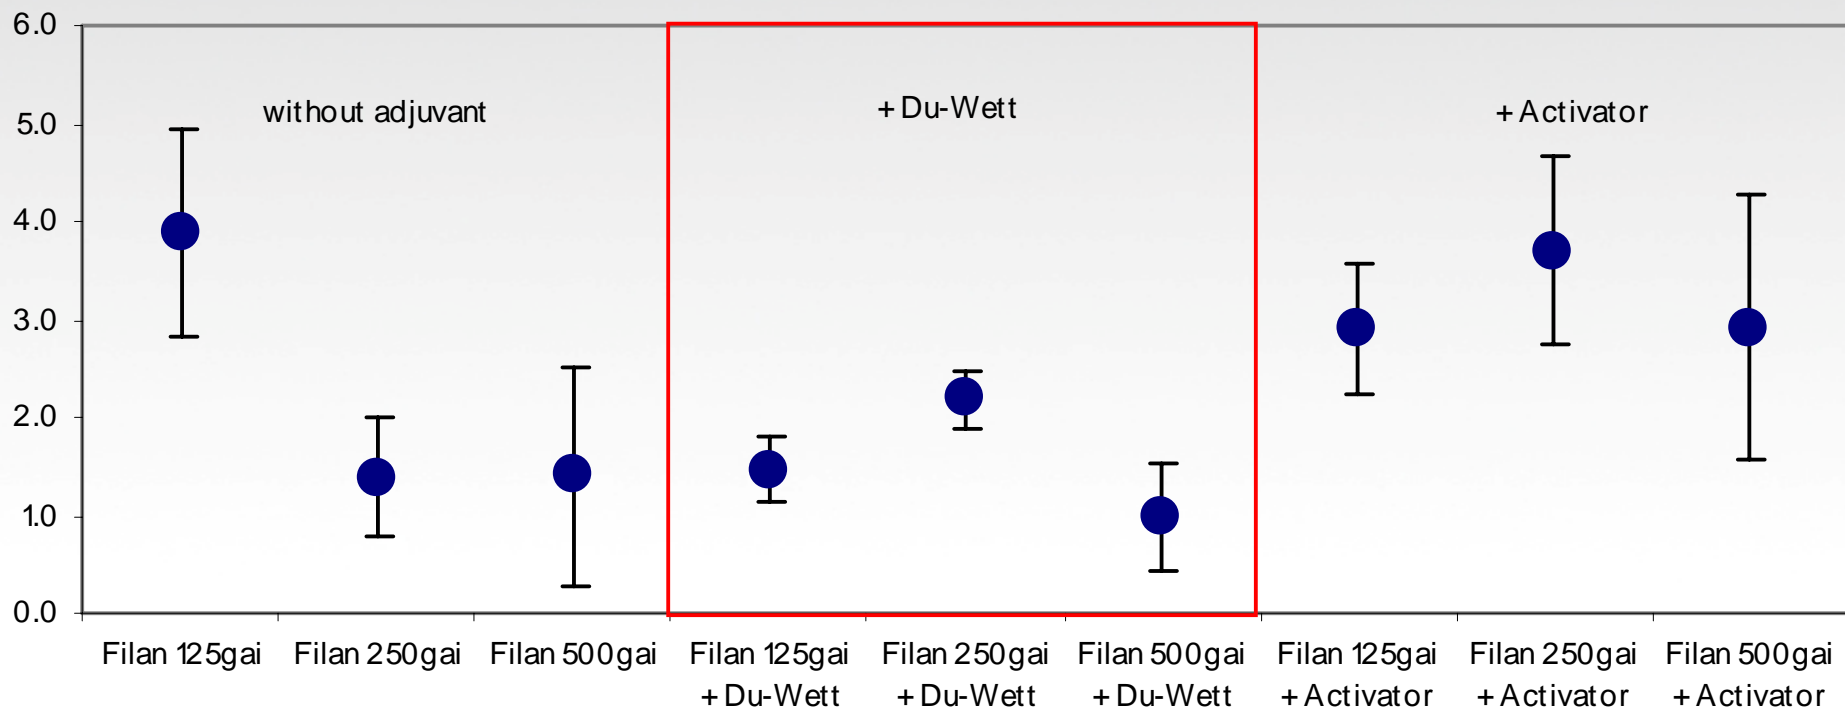

Spray adjuvant effects on Sclerotinia control

Wetting agents – effects on coverage & performance 2007 (measuring the variability in disease control)

% Sclerotinia infected plants +/- SE

Key findings

- Filan already has surfactant in its formulation, so only add another surfactant if further benefit can be gained.
- Activator slightly reduces performance of Filan.
- Du-Wett improves the performance of Filan. It reduces variability in disease control.
- This season, we are comparing Du-Wett against Agral, another commonly used wetting agent.
